¹Blood pressure cuffs used in non-invasive physiological vascular testing are a potential source of infection to patients and personnel. Studies have found up to 100% of “presumed clean” cuffs infected with bacteria including MRSA, C. diff, and staph. ²Compared to coated fabrics, the open weave of common nylon cuff fabric makes it the hardest to clean, and the worst for absorbing fluids, stain removal and disinfection. Ref: <https://www.xenolitexray.com/wp-content/uploads/2014/05/Apron-Cleaning-Sept-2013.pdf>
