Peripheral Artery Disease Screening Questionnaire

We want to make you aware of a condition that may affect you. Peripheral Arterial Disease (PAD) affects as many as 12 million Americans, with a significant number going undetected, posing potential risks.

PAD involves the narrowing of arteries that supply blood to the leg muscles due to plaque buildup. This process mirrors the one causing blockages in the heart.

Impaired blood circulation in the legs can lead to discomfort, pain, or fatigue, which in turn can limit physical activity. It's essential to note that untreated PAD may elevate the risk of heart attack, stroke, and even limb amputation.

Please take a moment to respond to this brief PAD screening. If you have any inquiries or concerns about PAD and your risk, please don't hesitate to ask.

Thank you for taking the time to complete this questionnaire. Your responses will help us evaluate your risk for Peripheral Artery Disease (PAD) and guide us in providing appropriate recommendations for your health. Please return this questionnaire to a healthcare professional or nurse upon completion.

^{*} Based on recent guidelines of the American Heart Association, the American Diabetes Association, and many other healthcare groups.
